

4	<p>A is the correct answer as a higher temperature both increases the number of conduction electrons released by a thermistor and increases the amplitude of the lattice vibrations.</p> <p>B is not the correct answer as the number of conduction electrons does not decrease</p> <p>C is not the correct answer as the amplitude of lattice vibrations does not stay the same</p> <p>D is not the correct answer as neither the number of conduction electrons decrease nor the amplitude of lattice vibrations stay the same.</p>	(1)
