

- 19 The diagram shows a crane lifting a load. There is a large mass called a counterweight attached to the crane, on the opposite side of the tower to the load.

- (a) The crane has an electric motor with an efficiency of 47%.

The crane lifts a load of $4.4 \times 10^4 \text{ N}$. The load moves through a vertical distance of 15 m in a time of 70 seconds.

Determine the average power input to the electric motor.

(4)

Average power input =

- (b) The horizontal distance from the load to the tower can be changed. The horizontal distance from the counterweight to the tower can also be changed.

- (i) Explain how the counterweight needs to move when the load is moved away from the tower.

(4)

- (ii) The beam is uniform with a weight of $3.0 \times 10^4 \text{ N}$.
The counterweight has a weight of $1.1 \times 10^5 \text{ N}$.
The load has a weight of $4.4 \times 10^4 \text{ N}$.

Deduce whether the load can be moved to the end of the beam without the crane toppling.
