

- 18 A student carried out an experiment to determine the viscosity of a liquid. He measured the terminal velocities v of several different glass spheres of diameter d , as they fell through the liquid.

The student used his measurements to plot the graph of v against d^2 shown below.

- (a) Explain what is meant by terminal velocity.

(2)

- (b) A glass sphere of diameter 35 mm is travelling through the fluid at terminal velocity.

Show that the drag force on this sphere is about 0.2 N.

density of glass $\rho_g = 2.52 \times 10^3 \text{ kg m}^{-3}$

density of liquid $\rho_s = 1.43 \times 10^3 \text{ kg m}^{-3}$

(5)

- (c) The student reads in a textbook that if Stokes' law is obeyed

$$v = kd^2$$

where k is a constant.

- (i) Deduce from the graph whether the flow of liquid around the spheres was laminar.

(3)

(ii) Determine a value for k using the student's graph.

(3)

$k =$

(iii) The constant k is given by

$$k = \frac{(\rho_g - \rho_s)g}{18\eta}$$

where η is the viscosity of the liquid.

Determine a value for η .

density of glass $\rho_g = 2.52 \times 10^3 \text{ kg m}^{-3}$
density of liquid $\rho_s = 1.43 \times 10^3 \text{ kg m}^{-3}$

(2)

$\eta =$
